

# Project Profile

## Freezer Concrete Repairs

The entrance to this freezer plant was severely damaged from constant forklift traffic. The plant operator needed a repair which could be carried out while temperatures were 20 degrees F. Shutting down the operation was not an option.

The problem was solved by **ADVANCED Polymer Repairs** with a high performance concrete repair product designed for application at temperature as low as -30 degrees F.

The loss of revenue and cost to empty the plant would have exceeded \$50,000 were it not for the innovative solution that **ADVANCED** provided.
