

Project Profile Step Repair and Protection

When this large property management company (6 million total square feet) called **ADVANCED Polymer Repairs** they were out of options. Traditional concrete repair costs were prohibitive and the down time would have been several weeks. Also, the landscaping repairs would have added thousands to the cost. Worse yet, the new concrete would have been just as susceptible to salt damage from ice removal products. **ADVANCED** solved their problem in only four days with a system whose cost was far less than concrete and was completely resistant to the effects of salt. The entrance was open at all times to the tenants and the system installed will outlive concrete by many years.
